

## The access channel to the eNX Suite modules

### An essential tool for the company's functional areas

The user-friendly graphical interface and the **possibility to configure charts**, indicators and system notifications make **eGate** an essential tool for all the company's functional areas.

The **eGate** module is inserted in a fully integrated manner, as preview of the entire system and lets you create three application functions for the **eNX** Suite:

## Customised module configuration

In the main window, designed as the base dashboard of the system, you can **configure the buttons for opening** the **eNX** modules in a customised and selective manner for each user; also, **eGate** is set up to **display information** in a Hierarchical system (the top level sees the lower levels, whereas vice versa is not valid).

## IDENTIFY IMPORTANT INFORMATION ACCORDING TO THE USER'S ROLE

It is possible to identify **important information to be displayed** in the “featured” area in the form of data charts, indicators or tables in a customised manner, always according to the user's role.

## WITH eGate NOTIFICATIONS ARE EASY AND IMMEDIATE

It is possible to **receive notifications** that the system generates and sends automatically as they are associated with **specific events** (such as machine downtime or start of a process).

**eGate** is the gateway to the **eNX** system which, on the one hand, **lays out and arranges** the use of the system and, on the other hand, **highlights key information** without the need to open queries or reports in an **easy and immediate** manner, even in sidebar mode.
