

The eNX suite module designed to manage the customer orders, supplier orders and subcontractor orders.

Thanks to **eSCM** you can graphically check the **orders processability**, given the currently confirmed production plan. Any changes to the planning made in **eSphere** affects **eSCM**.

CUSTOMER ORDERS

By clicking on the individual customer order, which may be green or red depending on whether or not the product can be processed on the date requested, **eSCM** displays its data and the **processability range**. If an order cannot be processed by the requested date, you can **change the delivery date** or browse **eSphere** to assess any **changes to the planning**.

eSCM is the ideal tool for anyone who needs to interact with the client: with a simple click you can know if the **product can be shipped** on the confirmed date, according to the production plan.

SUPPLIER ORDERS

For each individual supplier order you can graphically display the status (confirmed delivery date/unconfirmed delivery date) and with a simple click, its data.

SUBCONTRACTOR ORDERS

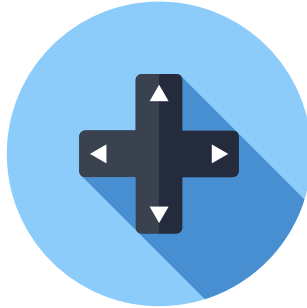

For each individual subcontractor order you can graphically display the status (confirmed delivery date/unconfirmed delivery date) and with a simple click, its data.

The strengths of the eSCM module

eSCM offers **complete navigation** along the entire Supply Chain, starting from the purchase and subcontracts orders up to customer orders.

Intuitive graphics

Navigation

Real-time data update
